

## **ecoterm – the versatile one**

**ecoterm** films are our most versatile composite films. They are produced on a polypropylene basis, one of the lightest plastics of all, and are characterised by their good temperature resistance.

One of the prominent competencies of Südpack is particularly thin **ecoterm** films, which due to their special processing methods constitute an intermediate step between rigid and flexible films. These films are characterised by their very high transparency and excellent thermoforming properties.

**ecoterm** characteristics:

- exceptional deep-drawing ability and excellent form stability
- use on standard FFS thermoforming machines
- above average transparency and perfect glossy appearance
- high throughput for forming
- low energy use in production and processing
- 

**ecoterm** films are available transparent and coloured if required. The films can be supplied with EVOH high barrier and/or peel equipped. **ecoterm** films are suitable for sterilisation/pasteurisation and for use in the microwave.
